

FileMaker® Developer Tools Map

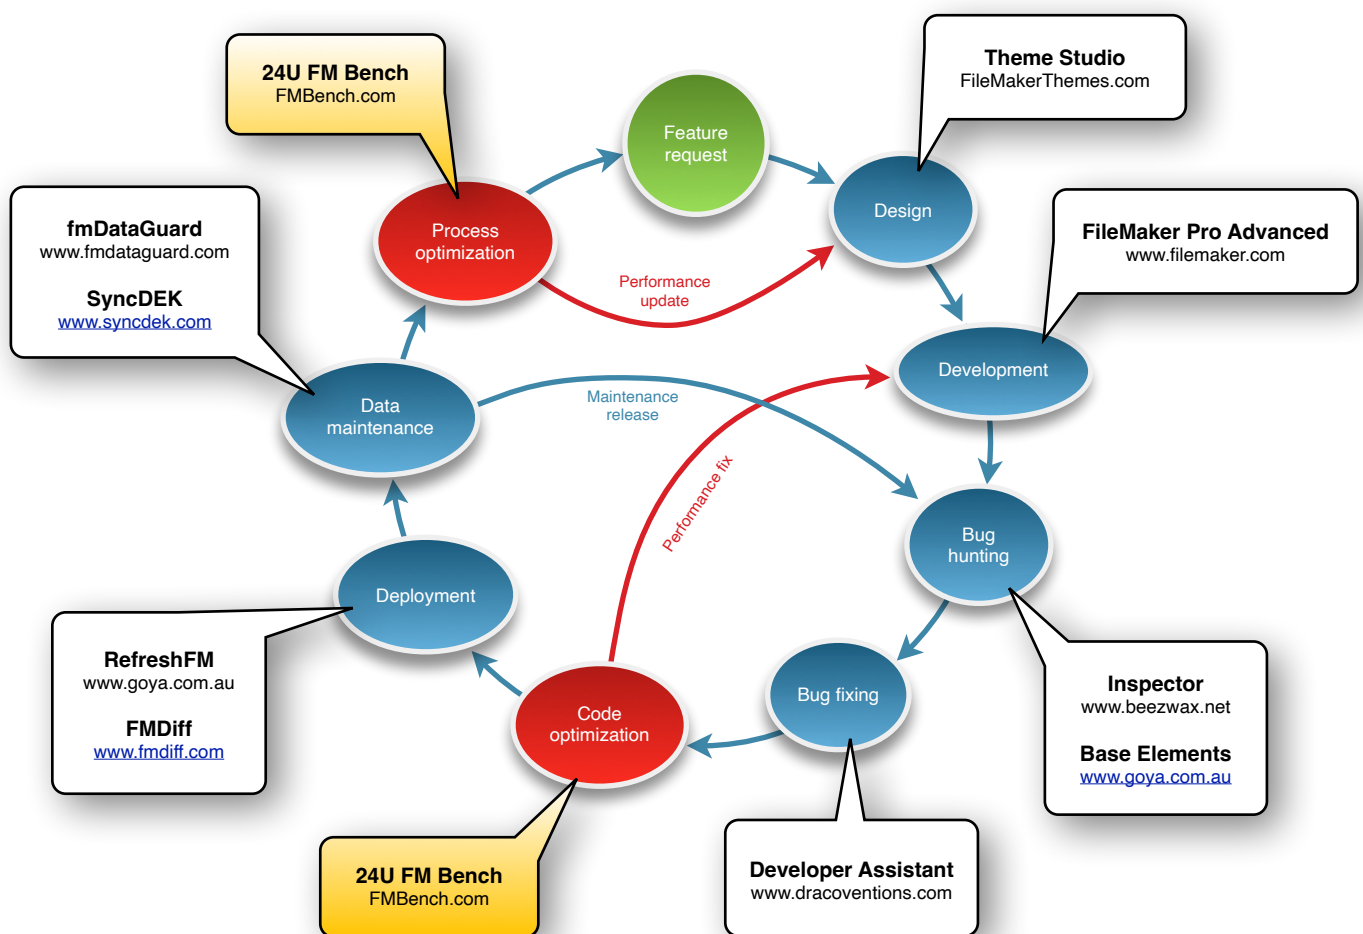

Version 1.3.5

FileMaker Developer Tools Map

We are providing the missing puzzle piece into the riddle of the FileMaker solution development and maintenance cycle.

Every solution goes through different stages during and these stages are usually repeated in cycles. If you want to maintain a long lasting success for your solution you have to take a good care of it during each of these stages.

As FileMaker development evolved, several different tools have been created to support this care and make it efficient even for complex solutions. To help you with finding the right tools for each specific life stage of your solution we have added them to the following map of the typical FileMaker solution's life cycle.'

24U FM Bench is a tool that fills the gaps in the map and helps you to take care of your solution's performance, from both the code and usage perspectives. It lets you measure the execution time of your scripts and find bottlenecks in your solutions, as well as examine how users work with your solution and optimize their processes.

FM Bench provides the missing puzzle piece but it's only one part of the picture. If you're serious about FileMaker development and want to take care of your solutions efficiently, we recommend that you get a good tool for each of the development and maintenance stages as shown above.
